

Stream

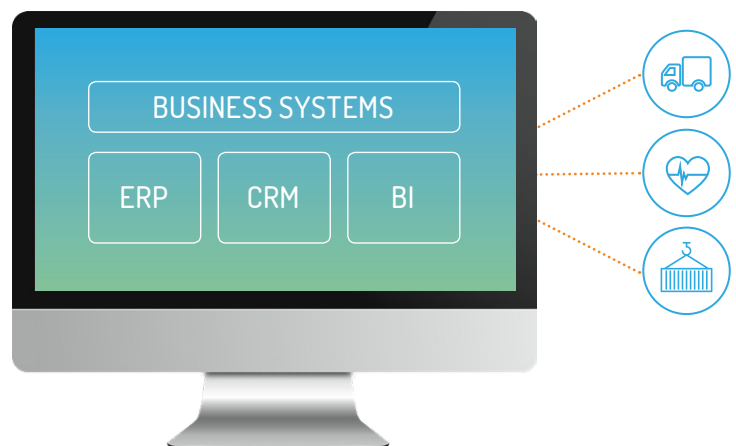

Capture, measure and monitor anything at any time

Stream provides a secure and comprehensive way to optimise connected devices

A Platform-as-a-Service solution that enhances existing business systems

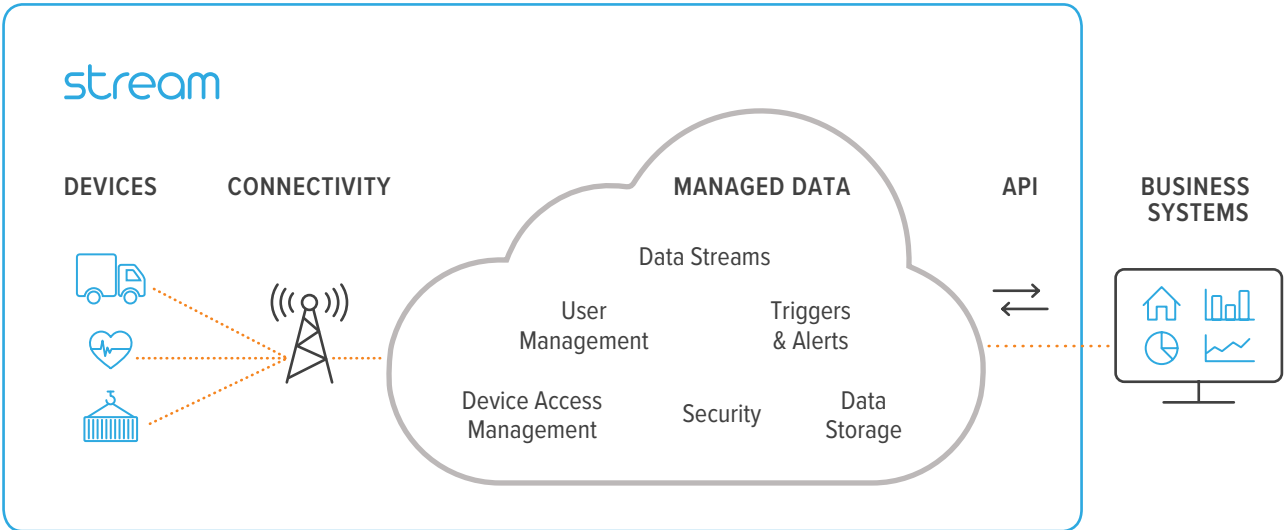

Stream provides immediate benefits by integrating with your existing business systems to increase asset utilisation, reduce servicing costs and improve reliability and customer satisfaction. Hardware, connectivity and data streams are easily managed and configured via a management portal. Data is streamed to existing business systems through APIs, automating the management of any portable asset and giving greater visibility and insight into asset location, operation and serviceability.

- ✓ Reduce costs
- ✓ Optimise asset utilisation
- ✓ Improve reliability

IoTStream sources hardware from world-class partners and offers a range of network connectivity. Capabilities include location tracking, external inputs and support for additional sensors as required. Devices may include internal batteries for long service life. APIs are available for integration with existing business systems including CRM, ERP, BI and asset management.

Stream allows you to manage single devices and scale to millions.

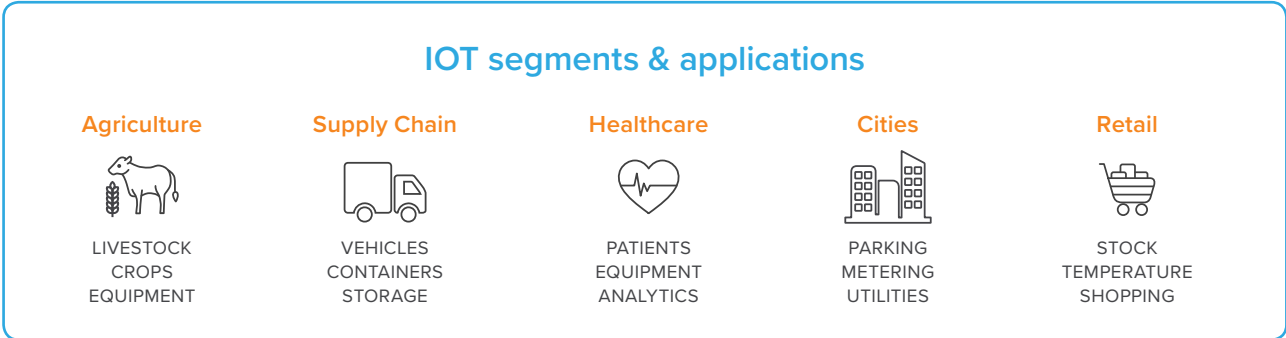

Stevenson uses Stream to capture remote engine hours on dump trucks located in their quarries and stream the data back into their asset management system. Accurate data capture reduces man hours and vehicle downtime.

Stream dramatically reduces the development time for IoT applications.

The end result is simplicity.

A single API that presents data, ready for your application to analyse and visualise.
